

## Setting Exposure

In this lesson, we'll be taking a look at  
**Setting Exposure.**

*Estimated Completion Time: **6 minutes.***

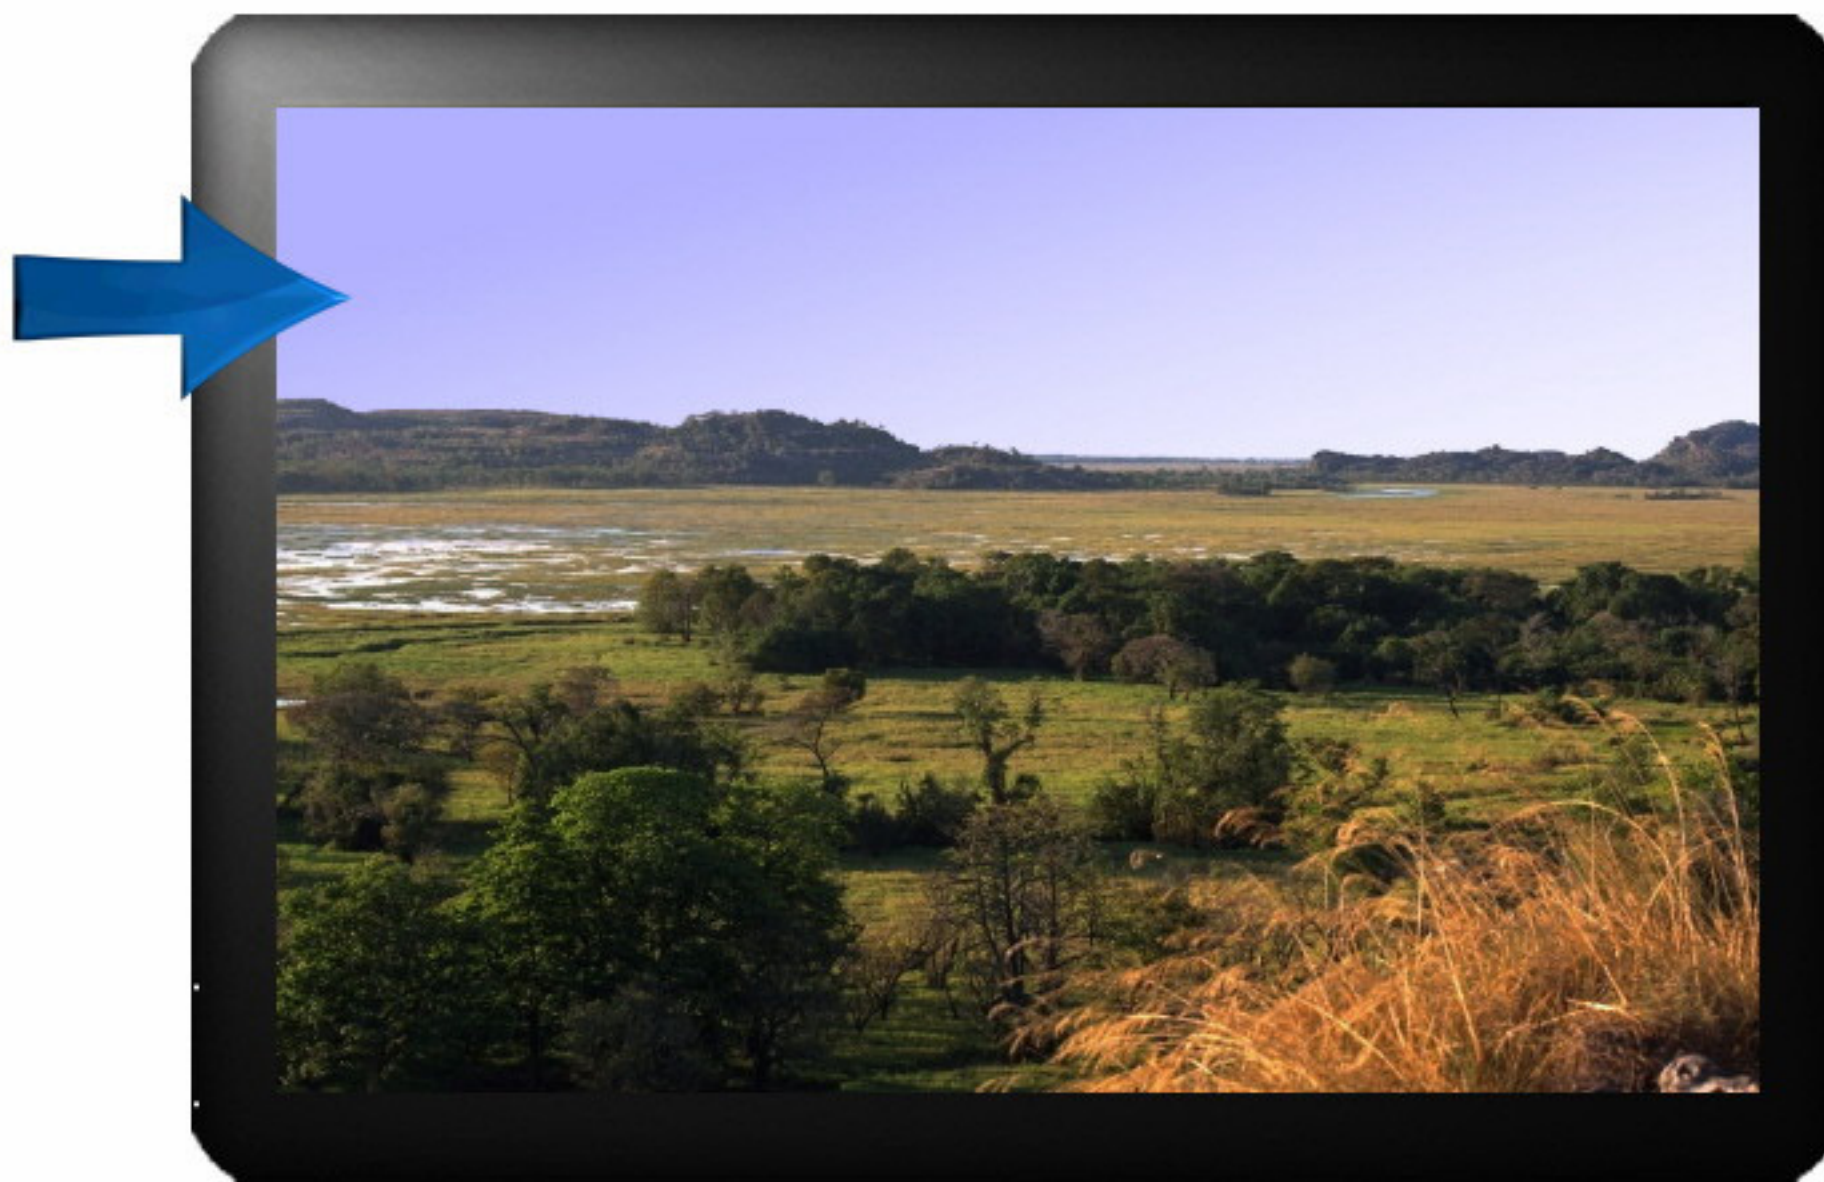

## Setting Exposure

On most mobile devices, you can set the point the camera uses to set exposure on any particular part of an image by touching it. In a moment, you'll be trying this with the example below.

## Setting Exposure

For example, let's assume the image below is us looking at a mobile device camera. Touch, or click, **on the sky** in the viewfinder.

## Setting Exposure

See how the exposure has changed? The sky is more blue - more colorful - but the rest of the image is a little darker (use the back button to try this again).

## Setting Exposure

This time, click or touch in the bottom part of the image.

## Setting Exposure

That looks a little better - both the sky and the scenery appear to be exposed well. When taking photos, feel free to move around the viewfinder and set the exposure in different places to get the best results.

## Setting Exposure

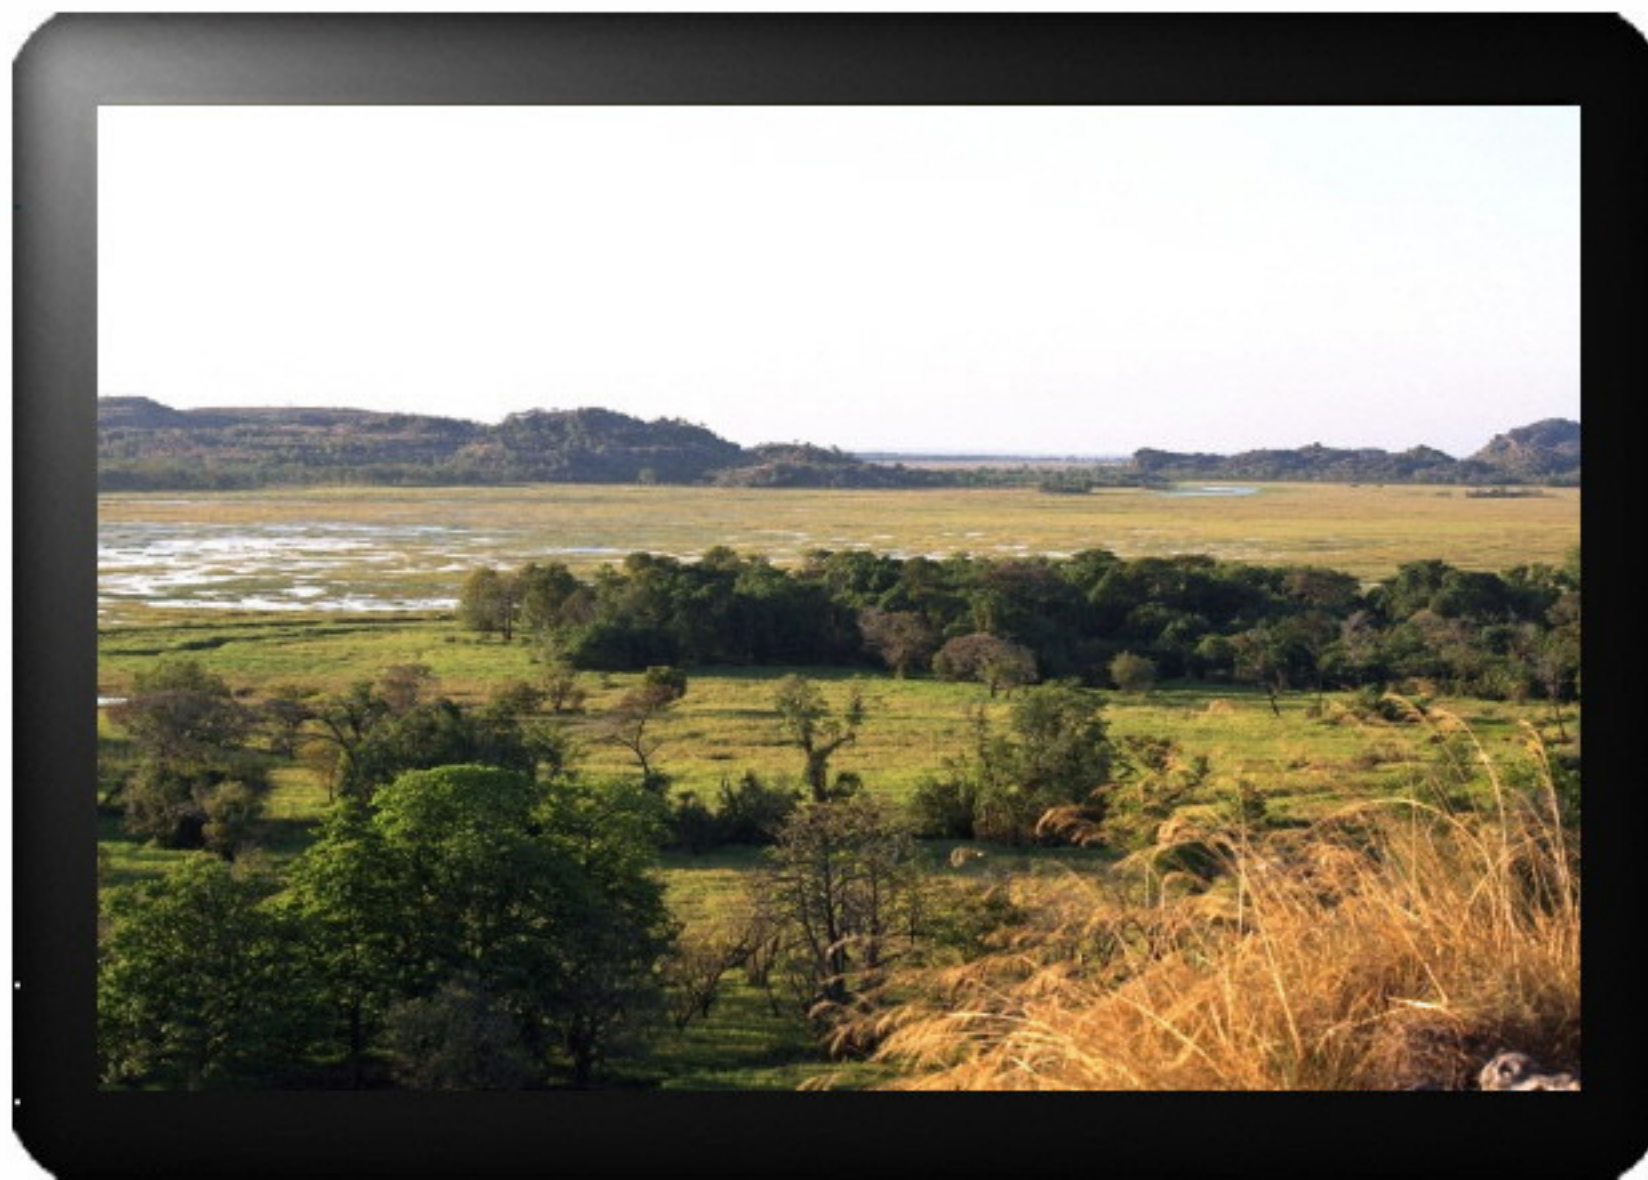

Try clicking on the area at the bottom right of the viewfinder image.

## Setting Exposure

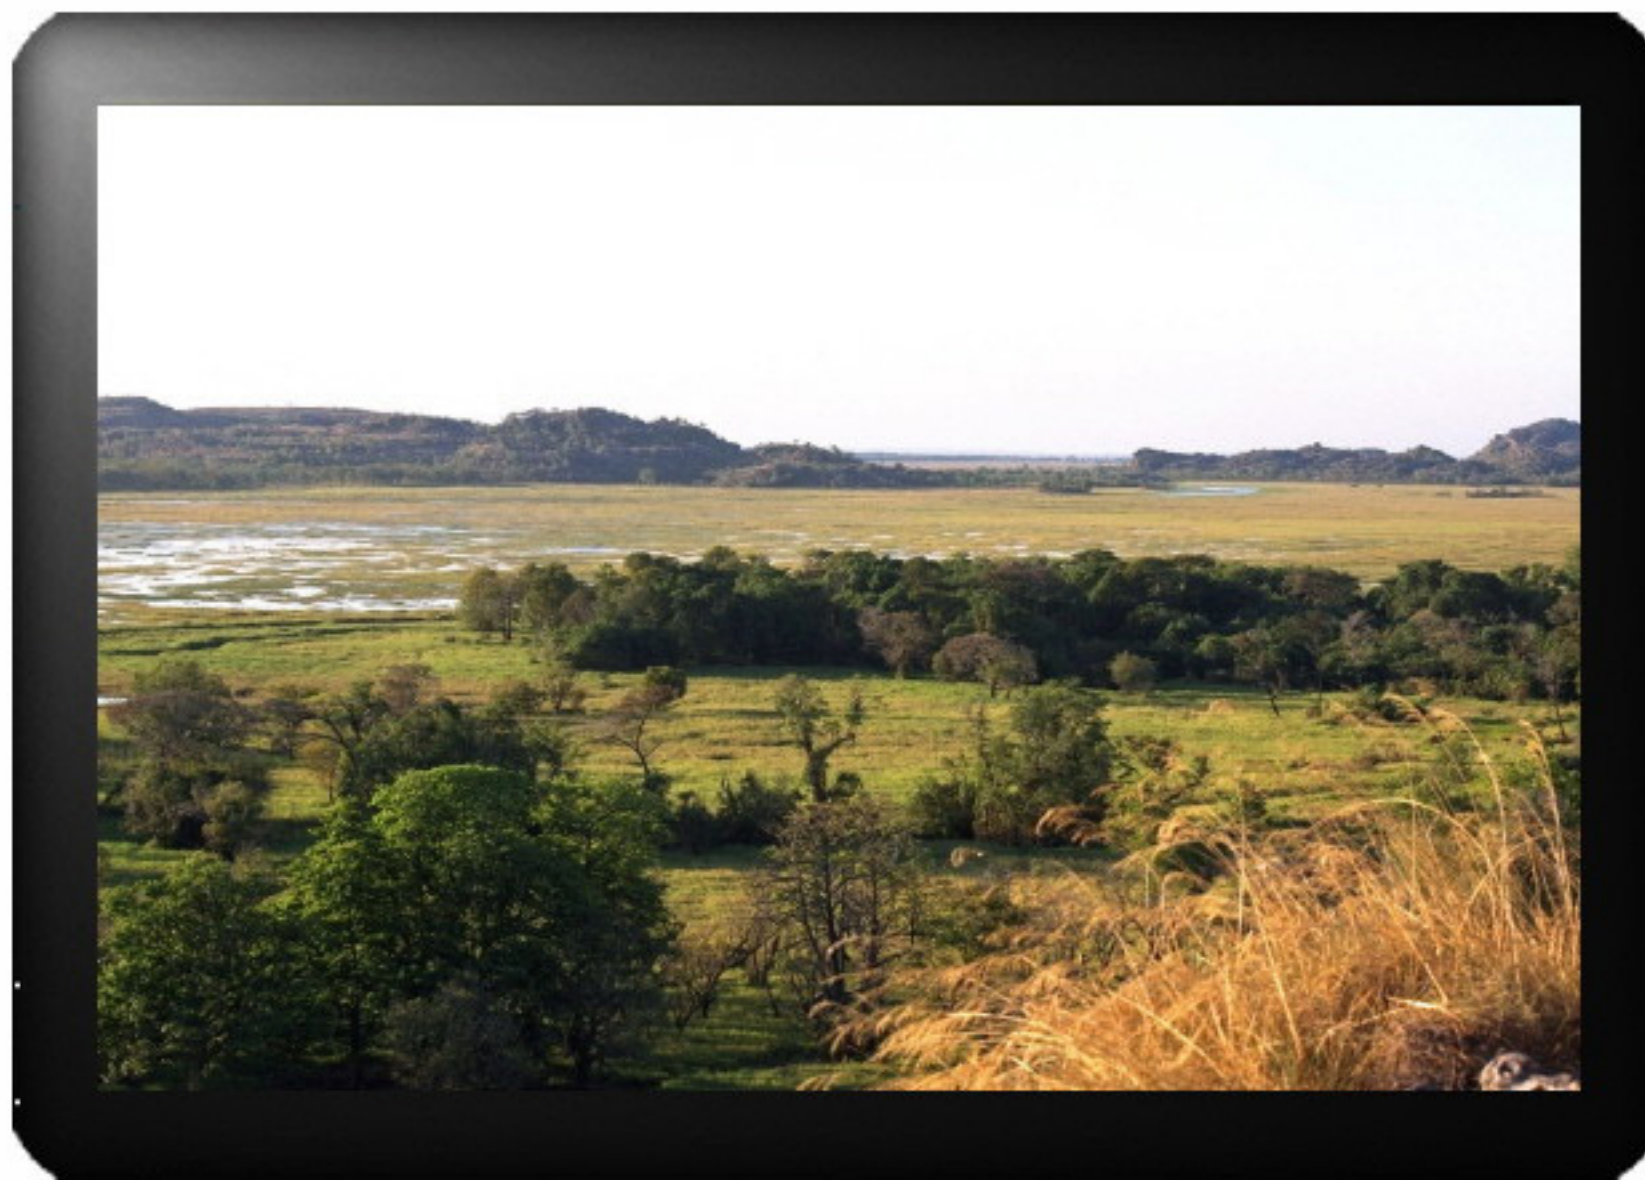

This time, the image is a little overexposed - the sky has lost all of its color - so we've probably picked the wrong exposure point for this photo.

## Setting Exposure

Touch any of the points on the image now, and have another look at how it can affect the exposure on the image. When you've finished, select the **Next** button, below.

## Setting Exposure

Touch any of the points on the image now, and have another look at how it can affect the exposure on the image. When you've finished, select the **Next** button, below.

## Setting Exposure

Touch any of the points on the image now, and have another look at how it can affect the exposure on the image. When you've finished, select the **Next** button, below.

## Setting Exposure

You've now completed this lesson.

In this lesson, we took a look at **Setting Exposure**.
